

## Today:

- Doping
- Carrier transport: scattering
- *Current*

## Rep: lecture 1

$T = 0\text{K}$ : VB: all states occupied, no holes  
 CB: no states occupied, no electrons

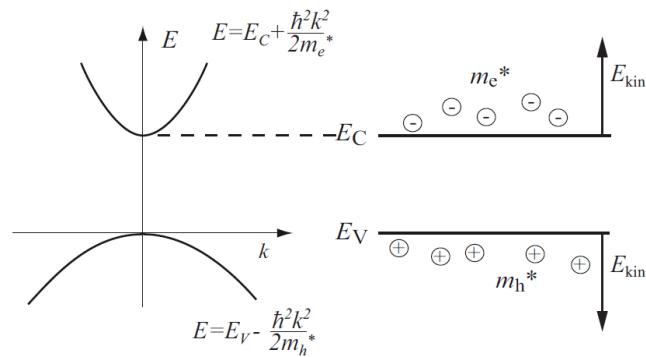

$T > 0\text{K}$ : Some carriers are thermally excited.

### Effective mass

$$\frac{1}{m_e^*} = \frac{1}{\hbar^2} \frac{\partial^2 E}{\partial k^2}$$

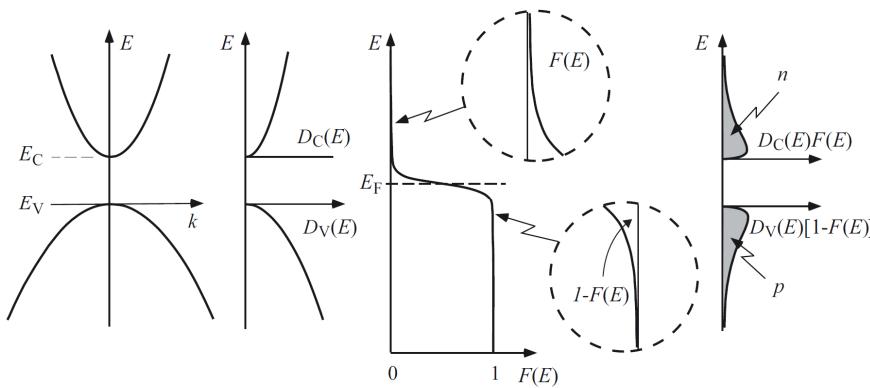

- Related to shape of the bands
- Summarizes crystal – carrier interaction
- Carriers respond to external force as if they had a mass  $\neq m_0$ .

$m_e > 0$  in the conduction band

$m_h > 0$  in the valence band

### Charge carrier concentrations:

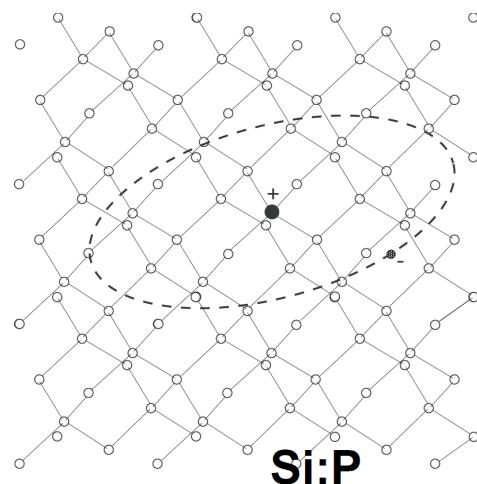

$$E_C - E_F \gg kT \Rightarrow F(E) \ll 1 \text{ f\"or } E > E_C$$

$$E_F - E_V \gg kT \Rightarrow F(E) \ll 1 \text{ f\"or } E < E_V$$

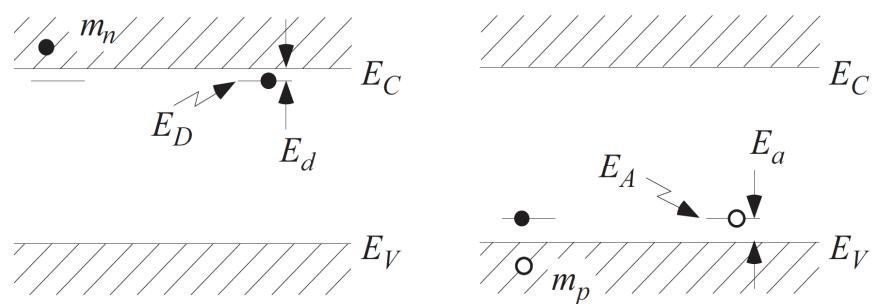

- Thermal equilibrium
- In any band state; small probability for charge carriers

$$n = N_C e^{-(E_C - E_F)/kT}$$

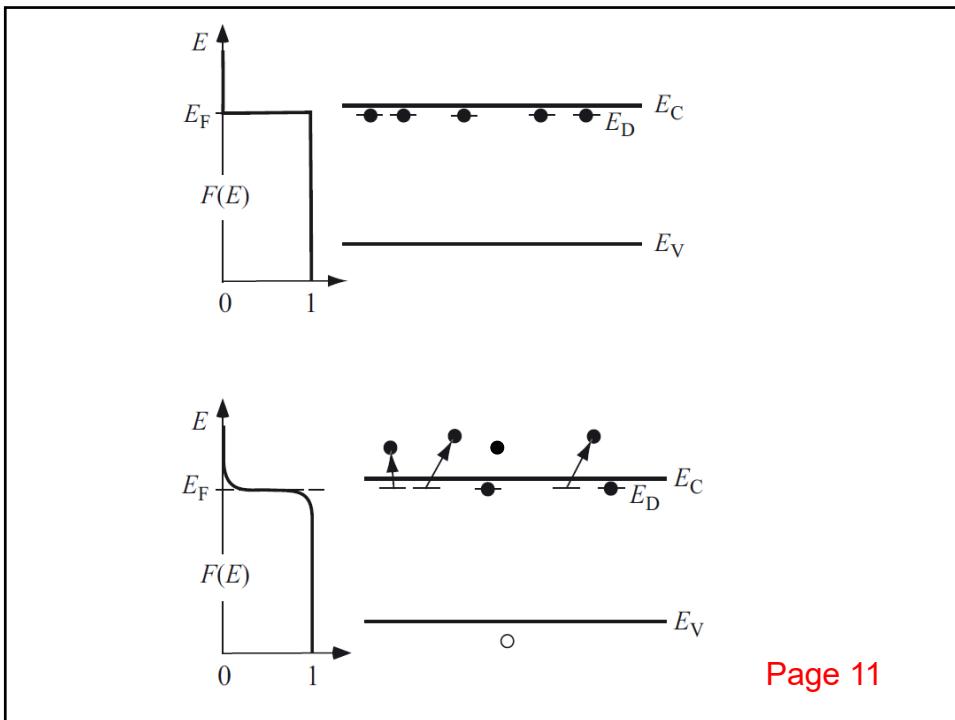

$$p = N_V e^{-(E_F - E_V)/kT}$$
